

**Redwood Shores Lagoon  
May 2015  
Monthly Water Quality Monitoring Report**

**Prepared for**

**Redwood City  
Public Works Services Department  
1400 Broadway  
Redwood City, CA 94063-2594**

**Prepared by**

**Clean Lakes, Inc.  
P. O. Box 3186  
Martinez, CA 94553**

**June 2015**

City of Redwood City staff Richard Chaffey performed the May monthly monitoring on May 28, 2015. Weather conditions were mostly cloudy (75%), the air temperature was 58 F, and moderate winds were recorded.

General water quality measurements for dissolved oxygen, clarity (as turbidity), salinity, pH, and temperature were recorded at Sites R-1 thru R-5. Nutrients, nitrate as N, and dissolved ortho-phosphate as P were sampled at R-1 thru R-5 via laboratory analysis. Water samples were collected for Fecal Coliform analysis at Sites R-1 and R-2. During each sample visit observations are noted for floatables, oil/grease films and scum, water discoloration, algae and aquatic plant growth, and any presence of dead birds or fish. Water Quality Objectives for Redwood Shores Lagoon is provided below as well Dissolved Oxygen (DO) requirements in Non-Salmonid waters by which to compare field and laboratory results.

**Table 1. Redwood Shores Lagoon Water Quality Objectives**

Parameter	Criteria
pH	6.5 – 8.5
Dissolved oxygen	Minimum of 5.0 mg/L
Chlorophyll-a	50.0 ug/l
Fecal coliform bacteria	A median not to exceed 240 MPN/100 mL in 5 consecutive samples with no single sample exceeding 1,000 MPN/100 mL
Color	No significant increase over that in sloughs
Oil, grease, and visable films	None
Floatables	None
Aquatic growths	None sufficient to cause nuisance conditions
Turbidity in Belmont, Steinberger and Bay sloughs that receive lagoon discharge	<u>Background Levels</u> <u>Max. Incremental Increase</u>
	50 NTU                                    5 NTU
	50-100 NTU                                10 MTU
	100 NTU                                    10 % of background

II. NON-SALMONID WATERS	DO mg/l
<b>A. Early life stages</b>	
No production impairment	6.5
Slight production impairment	5.5
Moderate production impairment	5
Severe production impairment	4.5
Limit to avoid acute mortality	4
<b>B. Other life stages</b>	
No production impairment	6
Slight production impairment	5
Moderate production impairment	4
Severe production impairment	3.5
Limit to avoid acute mortality	3

**RESULTS** - Water quality results for each site is provided below in Table format for 2015 to allow comparison of results from month to month.

**NUTRIENTS** – Orthophosphate as P (ORP) was detected at all sites in a range between 0.21 and 0.29 mg/l. The lowest site for ORP was at R-1 while R-4 measured the highest. ORP decreased at one site and remained the same or increased at the others sites in comparison to April. There were no detectable levels reported for Nitrate as N at any monitoring site.

Phosphorus and nitrogen are essential nutrients for the plants and animals that make up the aquatic food web. Since phosphorus is the nutrient in short supply in most fresh waters, even a modest increase in phosphorus can, under the right conditions, set off a whole chain of undesirable events in a stream including accelerated plant growth, algae blooms, low dissolved oxygen, and the death of certain fish, invertebrates, and other aquatic animals.

There are many sources of phosphorus, both natural and human. These include soil and rocks, wastewater treatment plants, runoff from fertilized lawns and cropland, failing septic systems, runoff from animal manure storage areas, disturbed land areas, drained wetlands, water treatment, and commercial cleaning preparations.

Inorganic nitrate as N should be less than 0.3 mg/L to avoid algal blooms. Excessive concentrations of nitrate in lakes and streams greater than about 5 milligrams per liter (measured as nitrogen), depending on the water body, can cause excessive growth of algae and other plants, leading to accelerated eutrophication or "aging" of lakes, and occasional loss of dissolved oxygen. Animals and humans cannot use inorganic forms of nitrogen.

# CLEAN LAKES INC.

Since phosphorus is often scarce in freshwater ecosystems, it is typically a limiting nutrient, meaning that it limits the amount of life the system can sustain. When humans add phosphate-rich sewage or agricultural runoff, algae growth may no longer be limited by the scarcity of phosphorus in its environment and may grow out of control. In order to control algae growth, the EPA recommends that phosphate levels not exceed 0.05 milligrams per liter for streams discharging into lakes or reservoirs, 0.1 milligrams per liter for lakes and reservoirs, and 0.1 milligrams per liter for other streams and rivers.

**FECAL COLIFORM** - The fecal coliform levels were measured at 7.8 MPN/100 mL and 17 MPN/100 mL for R-1 and R-2, respectively. Coliform decreased at R-2 in comparison to April 2015. These results are relatively close to the laboratory detection limit of 1.8 MPN/100 ml. Fecal coliform did not exceed established limits. Single sample results over 1,000 MPN/mL are considered to exceed limits.

**GENERAL WATER QUALITY ANALYSIS** – The Dissolved Oxygen (DO) level in May was measured slightly below the 5.0 mg/l threshold at site R-5. DO was highest at Site R-1 (7.76 mg/l) and lowest at Site R-5 (4.98 mg/l). Water temperature increased marginally, remained the same, or dropped marginally over April with temperatures ranging from 17.5 to 18.6 C. PH measurements were within limits at all Sites. Salinity measurements varied from approximately 28.02 ppt to a maximum of 32.51 ppt. Turbidity was within limits and varied between 15.6 and 46.2 NTU.
