Martinez, CA 94553

April 2017

City of Redwood City staff Richard Chaffey performed the March monthly monitoring on March 23, 2017. Weather conditions were sunny, the air temperature was 50 F, and light winds were recorded.

General water quality measurements for dissolved oxygen, clarity (as turbidity), salinity, pH, and temperature were recorded at Sites R-1 thru R-5. Nutrients, nitrate as N, and dissolved ortho-phosphate as P were sampled at R-1 thru R-5 via laboratory analysis. Water samples were collected for Fecal Coliform analysis at Sites R-1 and R-2. During each sample visit observations are noted for floatables, oil/grease films and scum, water discoloration, algae and aquatic plant growth, and any presence of dead birds or fish. Water Quality Objectives for Redwood Shores Lagoon is provided below as well Dissolved Oxygen (DO) requirements in Non-Salmonid waters by which to compare field and laboratory results.

Table 1. Redwood Shores Lagoon Water Quality Objectives

Parameter	Criteria
pH	6.5 – 8.5
Dissolved oxygen	Minimum of 5.0 mg/L
Chlorophyll-a	50.0 ug/l
Fecal coliform bacteria	A median not to exceed 240 MPN/100 mL in 5 consecutive samples with no single sample exceeding 1,000 MPN/100 mL
Color	No significant increase over that in sloughs
Oil, grease, and visible films	None
Floatables	None
Aquatic growths	None sufficient to cause nuisance conditions
Turbidity in Belmont, Steinberger and Bay sloughs that receive lagoon discharge	<u>Background Levels</u> <u>Max. Incremental Increase</u>
	50 NTU 5 NTU
	50-100 NTU 10 MTU
	100 NTU 10 % of background

II. NON-SALMONID WATERS	DO mg/l
A. Early life stages	
No production impairment	6.5
Slight production impairment	5.5
Moderate production impairment	5
Severe production impairment	4.5
Limit to avoid acute mortality	4
B. Other life stages	
No production impairment	6
Slight production impairment	5
Moderate production impairment	4
Severe production impairment	3.5
Limit to avoid acute mortality	3

CLEAN LAKES INC.

RESULTS - Water quality results for each site is provided below in Table format for 2017 to allow comparison of results from month to month.

SITE R-1

NUTRIENTS – Orthophosphate as P (ORP) was detected at every site in a range between 0.25 and 0.42 mg/l. The lowest site for ORP was at R-5 measuring 0.25 mg/l, while R-1 measured 0.42 mg/l. ORP concentration increased at every site, in comparison to February. Nitrate as N was not detected at any site in March. Chlorophyll-a was detected at R-1 measuring 0.025 mg/l. The Chlorophyll-a result was within the 0.050 mg/l limit.

Phosphorus and nitrogen are essential nutrients for the plants and animals that make up the aquatic food web. Since phosphorus is the nutrient in short supply in most fresh waters, even a modest increase in phosphorus can, under the right conditions, set off a whole chain of undesirable events in a stream including accelerated plant growth, algae blooms, low dissolved oxygen, and the death of certain fish, invertebrates, and other aquatic animals.

There are many sources of phosphorus, both natural and human. These include soil and rocks, wastewater treatment plants, runoff from fertilized lawns and cropland, failing septic systems, runoff from animal manure storage areas, disturbed land areas, drained wetlands, water treatment, and commercial cleaning preparations.

Inorganic nitrate as N should be less than 0.3 mg/L to avoid algal blooms. Excessive concentrations of nitrate in lakes and streams greater than about 5 milligrams per liter (measured as nitrogen), depending on the water body, can cause excessive growth of algae and other plants, leading to accelerated eutrophication or "aging" of lakes, and occasional loss of dissolved oxygen. Animals and humans cannot use inorganic forms of nitrogen.

Since phosphorus is often scarce in freshwater ecosystems, it is typically a limiting nutrient, meaning that it limits the amount of life the system can sustain. When humans add phosphate-rich sewage or agricultural runoff, algae growth may no longer be limited by the scarcity of phosphorus in its environment and may grow out of control. In order to control algae growth, the EPA recommends that phosphate levels not exceed 0.05 milligrams per liter for streams discharging into lakes or reservoirs, 0.1 milligrams per liter for lakes and reservoirs, and 0.1 milligrams per liter for other streams and rivers.

FECAL COLIFORM - The fecal coliform levels were measured at 7.8 MPN/100ml and 23 MPN/100ml for sites R-1 and R-2, respectively. Coliform levels increased in both sites in comparison to February 2017. Fecal coliform did not exceed the established limits. Single sample results over 1,000 MPN/100mL are considered to exceed limits.

GENERAL WATER QUALITY ANALYSIS – The Dissolved Oxygen (DO) levels in March exceeded the 5.0 mg/l threshold in every site. DO was highest at Site R-1 (8.70 mg/l) and lowest at Site R-2 (6.57 mg/l). Water temperature increased at every site except R-5 during March, with temperatures ranging from 14.0 to 17.1 C. PH measurements were within the limit at every site except for R-1, ranging from 7.8 to 8.7. Salinity measurements varied from approximately 19.35 ppt. to a maximum of 22.56 ppt. Turbidity was within limits and varied between 10.4 and 98.7 NTU. There was an additional site where the PH and Dissolved Oxygen were monitored at R-1. The DO measured 9.93 mg/l and the PH measured 8.7. It was noted in the field data sheet that the pumps were running in R-4, but were not running in R-5 during the time of sampling. It was also noted that a pollen film was observed on top of the water in R-5.
